7. Abstract:

This report is a bibliography of the work reported in the literature on the effects of low temperature on the properties of structural materials. Some of the newer areas of cryogenic technology such as superconducting machinery involve environments which may subject the components to temperature as low as 4 K. Exposure of structural materials to such low temperatures affects their properties. This bibliography contains 963 references published between 1950-1976, arranged in chronological/alphabetical order. Combined material/property indexes are provided.

8. This report discusses the work reported in the literature on the low temperature properties of structural materials.
9. This report will be useful to materials engineers, chemical engineers, cryogenic equipment designers, gas engineers.
10. Industries using the information in the report will include electronics, shipbuilding, power equipment, and gas companies.
11. Associations or societies who may appropriate mailing lists are ASM, AIChE, American Bureau of Shipping, ASME, SAMPE.
12. Key words: Bibliography, Ceramics, Cryogenics, Low Temperature Tests, Metals, Electrical Properties, Magnetic Properties, Mechanical Properties, Thermal Properties.
13. NTIS Scope-Note Code: 59G, 60G, 71F, 71J, 71N

#### ACKNOWLEDGEMENT

This document was prepared by the Metals and Ceramics Information Center (MCIC), Battelle's Columbus Laboratories, 505 King Avenue, Columbus, Ohio 43201. MCIC's objective is to provide a comprehensive current resource of technical information on the development and utilization of advanced metal- or ceramic-base materials.

The Center is operated by Battelle-Columbus under Contract Number DSA900-76-C-2471 for the U.S. Defense Supply Agency; technical aspects of MCIC operations are monitored by the Army Materials and Mechanics Research Center. The support of these sponsor organizations is gratefully acknowledged.

This document was prepared under the sponsorship of the Department of Defense. Neither the United States Government nor any person acting on behalf of the United States Government assumes any liability resulting from the use or publication of the information contained in this document or warrants that such use or publication will be free from privately owned rights.

## INTRODUCTION

### PURPOSE

The purpose of this document is to provide a ready reference to pertinent literature related to the effects of low temperatures on the properties of structural materials. One important area of technology which uses materials at low temperatures is superconducting machinery. Advances in the development of superconducting machinery have indicated that superconducting generators, motors, transmission lines, and other electrical equipment are more efficient, occupy less space for equivalent capacity and have other advantages over most conventional equipment. Because of these advantages, there is considerable incentive to develop superconducting systems for certain military, as well as non-military applications. One particularly important area would be transportation systems. Environments involved may expose the components to cryogenic temperature as low as 4 K, which would require considerable new design technology. Exposure of structural materials to such low temperatures definitely affects the properties of the materials of construction.

### SCOPE

A bibliography with descriptors is presented on the mechanical, thermal, electrical, and magnetic properties of selected materials at low temperatures. Temperatures which are readily attainable for testing range from +25 C to -269 C are shown in Table 1.

### TIME PERIOD

References to 963 documents published between 1950 - 1976 are arranged in a chronological/alphabetical order.

### DATA SOURCES

Data sources used for the bibliography include the technical journals listed in Table 2 plus Government-sponsored reports, books, technical symposia, and industrial literature.

### ORGANIZATION AND FORMAT

Bibliographic items appear in alphabetical order by year of publication. A continuous numbering system is used throughout the bibliography. The assigned numbers appear as location addresses in all Material/Property Indexes and in the First Author Index.

### Descriptors

Descriptors for the bibliographic items are formed as follows: *Special Document Type* (review, compilation, etc.)/*Materials/Specific Properties/Temperature* (lowest reported in a given report).

Descriptor terms for composites are formed in a consistent manner. For the term "fiberglass/epoxy composite", the reinforcing material is fiberglass and appears to the left of the slash mark while the matrix material (epoxy resin) has been placed to the right of the slash mark. Thus, the format for all composite materials is: *(Reinforcement Material)/(Matrix Material)*.

### **Material/Property Indexes**

Combined Material/Property Indexes are provided for the convenience of readers. References relating to the mechanical properties of a material are readily identified and completely separated from the thermal, electrical, and magnetic properties of that same material. For example, data for Inconel X-750 is retrievable from four separate indexes:

- Material (Inconel X-750)/Mechanical Property Index
- Material (Inconel X-750)/Thermal Property Index
- Material (Inconel X-750)/Electrical Property Index
- Material (Inconel X-750)/Magnetic Property Index

A tabulated summary of material groups and their associated properties is given in Table 3.

In the published literature, research studies on materials are normally reported with various designations, trade names and common usage nomenclature. For consistency, several designations were changed in accordance with accepted international alloy descriptors. Table 4 gives equivalent designations and common usage/trade names for some of the indexed materials.
